SKYPRO®
Walk in heaven

Ambicork - we added cork, a full natural and sustainable material, that has unique properties, such as lightness, thermal insulation, resilience, cushioning, good humidity control and good resistance to mold and mildew. In our crew shoes, a cork inner layer is applied onto the insole ensuring user's protection either in cold (snow or ice) or hot environments (hot airplane tracks), providing additional comfort to the feet, through a better thermal insulation.

100% Leather - All the leathers used in SKYPRO shoes are tested at independent laboratories to ensure they are free of any dangerous substances (chromium, aromatic amines, Chlorophenols, Formaldehyde, Organotin compounds, FMFY and heavy metals) that affect human health since can rapidly enter the body through the skin resulting in injuries like dermatitis, eczemas and adverse health effects, including neurological damage and cancers.

Anti-static - Our research team carries on the development of a technology supported by specific materials with proven anti-static properties and a special shoe construction, which ensures a controlled dissipation of electric discharges, leaving the body and reaching the ground in safer conditions, and ensuring users full protection against electrostatic discharges.

Anti-skid - Innovative materials with suitable slip resistance; Specific groove orientation and design; Improved ground/shoe interaction

Alarm-free - alarm-free technology that replaced the metal parts by integrating innovative composite materials that ensure the same physical and mechanical properties and perform as common metal-based components, that supports and guarantees the shoe stability, especially in medium/high heels, by connecting the heel to the shoe forepart, providing a better plantar pressure distribution for an improved comfort.

Absolute Comfort - Shock and heel strike absorption, by attenuation of the impact waves generated during gait, preventing musculoskeletal disorders; Improved flexibility, via a laminated structure of high performance materials that provide higher flexibility during gait and superior comfort. When exposed to dynamic compression testing, does not lose more than 5% in thickness after 100.000 compression cycles; Breathable technology, allowing feet to breathe, while keeping a suitable temperature inside the shoe; Softness and resilience; Absorption of ground impact, moving up through the musculoskeletal system, and protecting your spine and joints.
